# VISUALIZATION OF EHR DATA

DATA VISUALIZATION OF  
ELECTRONIC HEALTH RECORD  
(EHR)

# VISUALIZATION OF EHR DATA

**DATA  
VISUALIZATION  
OF ELECTRONIC  
HEALTH RECORD  
(EHR)**

**EHR**

Electronic Health Records contains multi-event and multi-sequence data for a big amount of patients. Visualisation that effectively shows Clinical Health Information can help professionals to make rapid life-critical decisions in busy distracting environments and help physicians to get insights on medical events.

Simple and intuitive visualisation designs minimizes the learning efforts of the untrained users.

## project info

---

8 weeks / 2018.03 - 2019.05  
College Studio / team work

## project goal

---

Create an innovation method for electronic health record (EHR), which shows a big number of event sequence data in one graph.

## team

---

CHEN Lei Monica (Italy),  
LI Yufan (China),  
LIN Yuhong (China),  
FOZIANO Maria Ludovica (Italy)

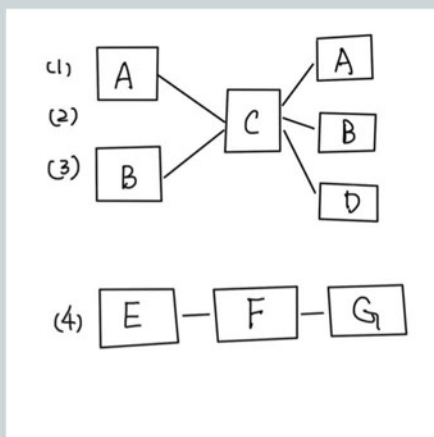

## personal responsibilities

- 
- Concept Design Phase:  
data analysis; creative ideas
  - Visualization Phase:  
sketch; interaction animation
  - Application Phase:  
evaluate document, user test

## data analysis

### • from data to graphics

The original data is the electronic health event sequence record of tens of thousands of patients.

1. First, focusing on one patient, according to the time axis and the type of event, the original data was converted into a linear incident chart.
2. The event type is reflected in the positional relationship between color and point.
3. To further simplify the graph of event points, abstract a representative typical event pattern (including a series of event points).

### • from linear to circle

Consider displaying event data for multiple patients at the same time.

1. The linear display method has many defects: it is impossible to restore the actual path of each patient; it is difficult to display the repeating pattern in the linear display.
2. Try to display the data in a semicircle. Abstract all the event patterns, summarize the typical event patterns into different stages, and display the data in a semicircular manner.

## design concept

visual  
ecoding and  
visualization

● DESIGN

### visualization: VISUAL ENCODING

#### PATIENT GROUP

Length ---- Proportion

Color

Hue ---- Big group

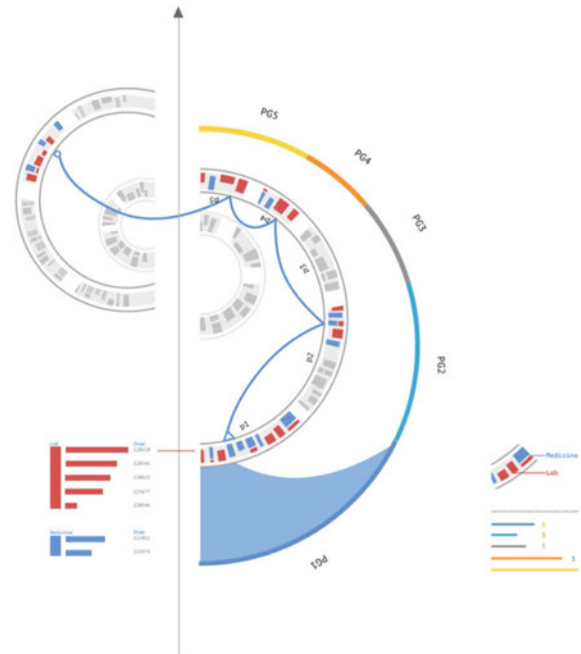

Value ---- Small group

Half Circle ---- Big group

Triangle ---- Start

Circle ---- Ending

## interaction

## visualization and interaction

first version

# application

## senario

### verification

The doctor wants to verify how many patients go through a specific pair of patterns he is interested in.

### discovery

The doctor wants to find some abnormal patterns.

## interaction and functions

► SELECT TWO MAIN GROUPS

► SELECT ONE OF THE MAIN GROUP TO SEE THE PATTERN OF ITS ITEMS

► HOVER OVER THE SMALL GROUPS TO SEE ITS DETAILS

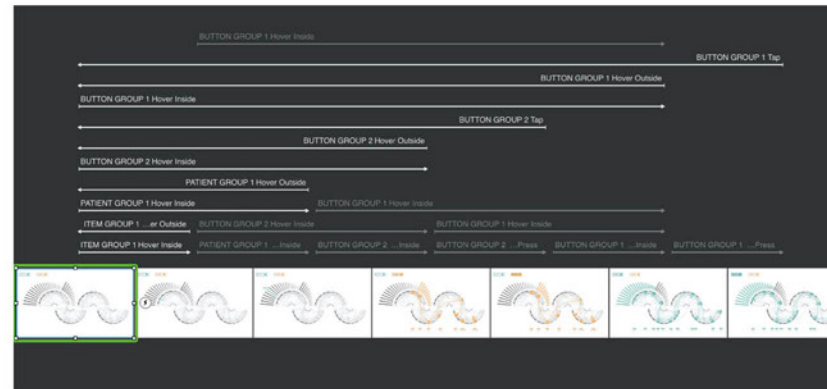

► SELECT A SPECIFIC GROUP OF PATIENTS TO SEE ITS PATH AND ITS DESCRIPTION.

# evaluation

## evaluation documents

prepare tutorial document and tasks to evaluate the prototype.

**Evaluate document**

- Introduction**  
We design an interactive visualization for event sequences data. It gives an abstraction view of event sequences in patterns and paths. The data we use is about the medicine and lab names patients takes and the time they take. We hope this visualization can be a tool to help doctors or medical researchers to improve medical care.
- Training**  
**search identify**  
patients  
Items—item names, can be sorted into categories  
categories—medicines & labs (maybe more later)  
patterns—a specific temporal sequence happened of many patients, consists of categories, ordered in time  
paths—some of patterns lined together  
patient groups—patients who share one path
- Data**  
PatientID  
ItemID  
ItemCategory, time1, ItemCategory, time2, ItemCategory, time3...
- Interaction**  
zoom  
Hover—highlight  
Click—details  
Multiple choice—multiple highlight and details

- Tasks**  
**Read the graphic—Think aloud**  
Use search interaction, hover and click.  
1. Find the number of patients in a specific patient group  
2. Find how many patients go through one pattern  
3. Find out which pattern is used by most groups / patients  
4. Click to get patterns detail / group's detail  
5. What is the most common item in a specific pattern, what is the percentage of lab in this pattern / what is the most common item in a specific group, what is the percentage of lab in this group
- Analysis the graphic**  
Use advanced interaction, multiple choice  
6. Find all groups/patterns that go through a specific pair of patterns  
7. Find abnormal path (we put one abnormal path in the picture to see whether user can find it or not)

## users & tests

Invite two medical graduate students to participate in prototype testing.

李娜娜  
medicine student  
Tongji University

刘利芬  
medicine student  
Tongji University

## feedbacks

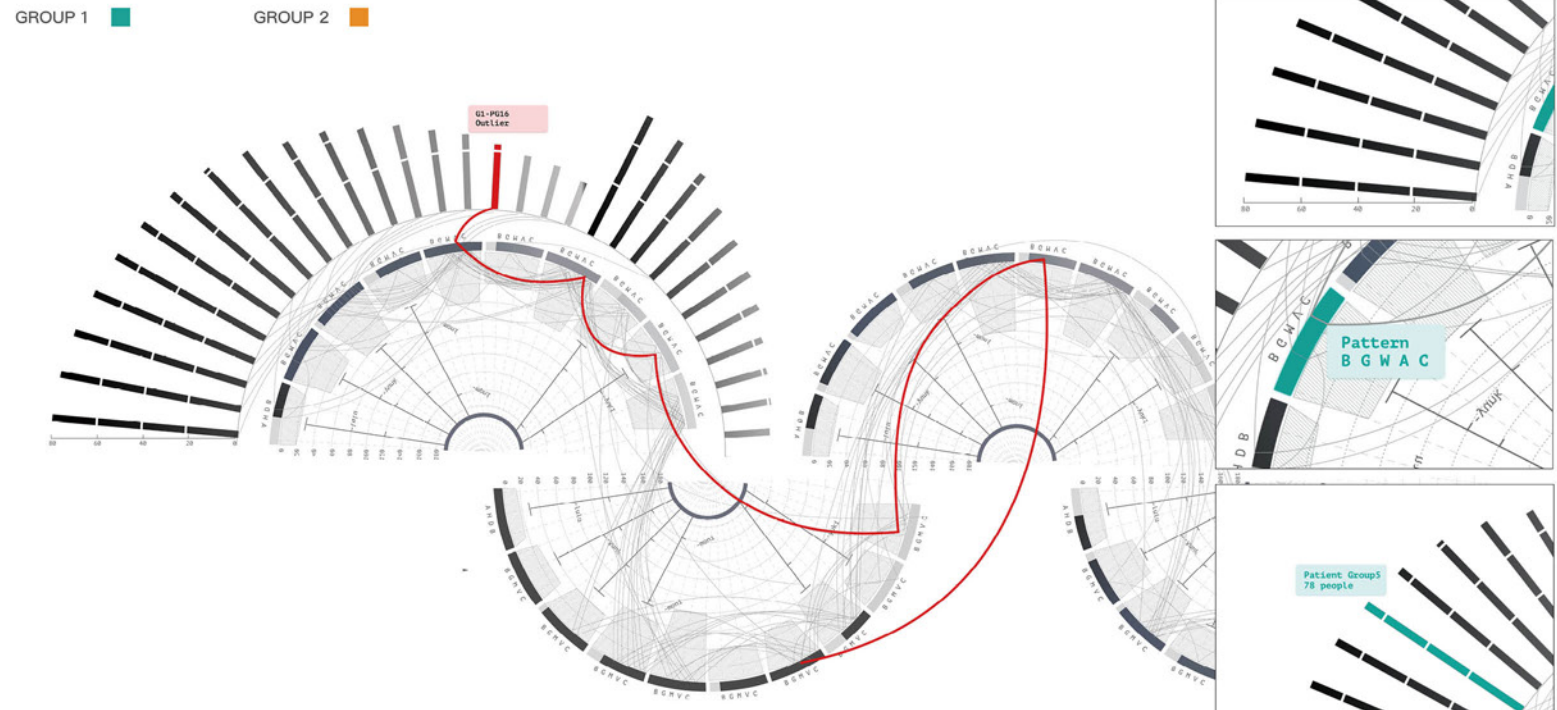

### Experience questionnaires and problems

- More explanation needed for first time users before the beginning of the test, because they felt confused before remembering all the visual encodings.
- *Big patient groups* and *small patient groups* made them confused at first.
- Some numbers are not clear in the visualization, like the numbers of patients in each group.

## refinement

1. Add scale
2. Add tooltips
3. Make outliers clearer

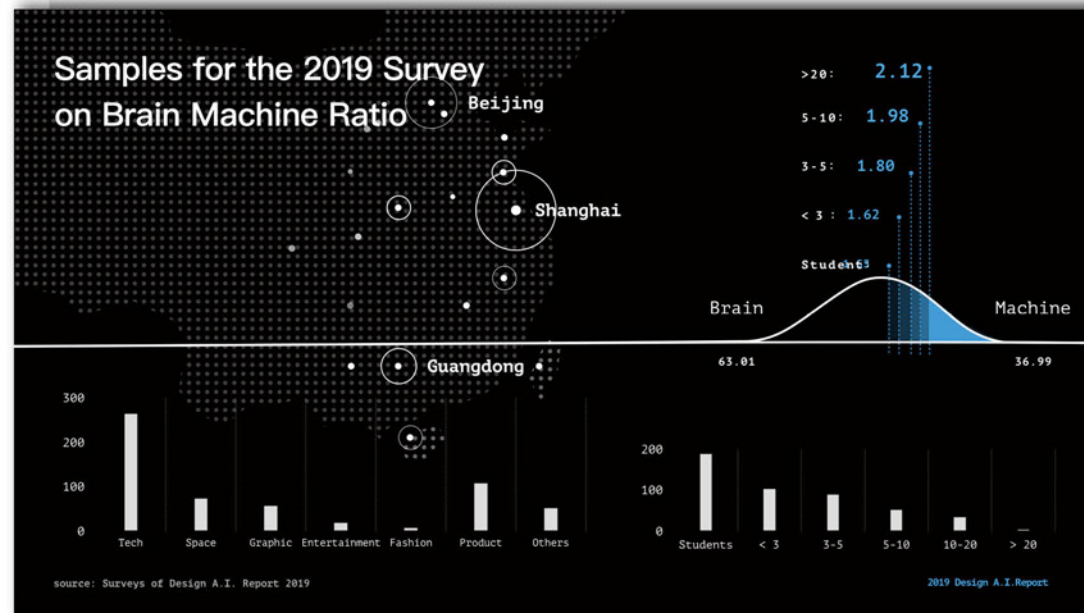

## Responsible for Chapter 3

In February 2019, the 2019 Brain-Computer Ratio Research and Test Activity was launched, 480 valid questionnaires were recovered, and human-machine collaboration data from students to designers with more than 20 years of industry experience were obtained. The sample covers 23 provinces and cities, including the six design industries of product, Internet, plane, space, entertainment and fashion.

At the same time, more than 40 design industry companies were invited to participate in the survey to investigate the willingness, difficulty and landing scenarios of the company to introduce artificial intelligence technology in the design work.

## 2019 Survey on Brain Machine Ratio\*

\* Brain Machine Ratio: Some argue that A.I. will replace humans workers. This report avoids using the terminology of "replacing" threats for the creative human workforce. It is more appropriate to describe Brain-Machine Ratio as the proportion of human and machines.

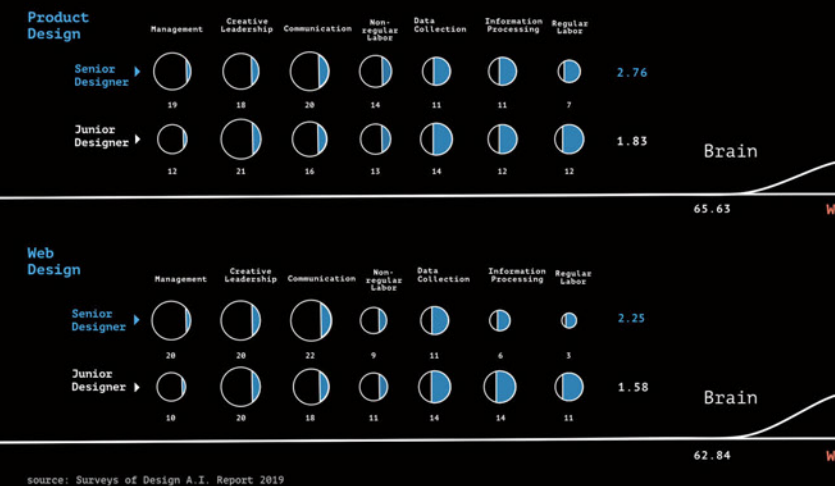

### Willingness to use A.I. for Design Work

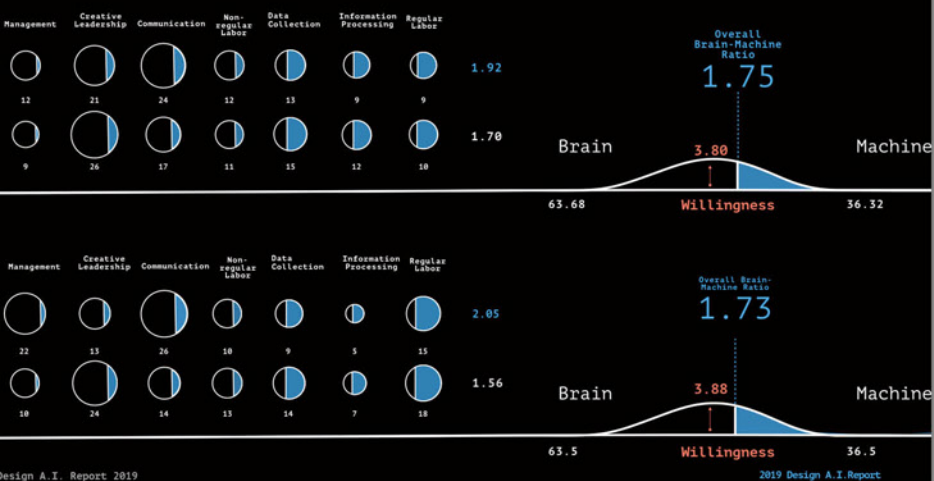

### Possibility of Automation for Various Kinds of Design work

# Machine Ratio/ Japan\*

ceived 171 responses from Japanese designers of various levels of experience, from six major design industries. With regards to willingness to acceptance of automation, Japanese designers are more conservative than Chinese designers. Here are some examples of the responses from designers.

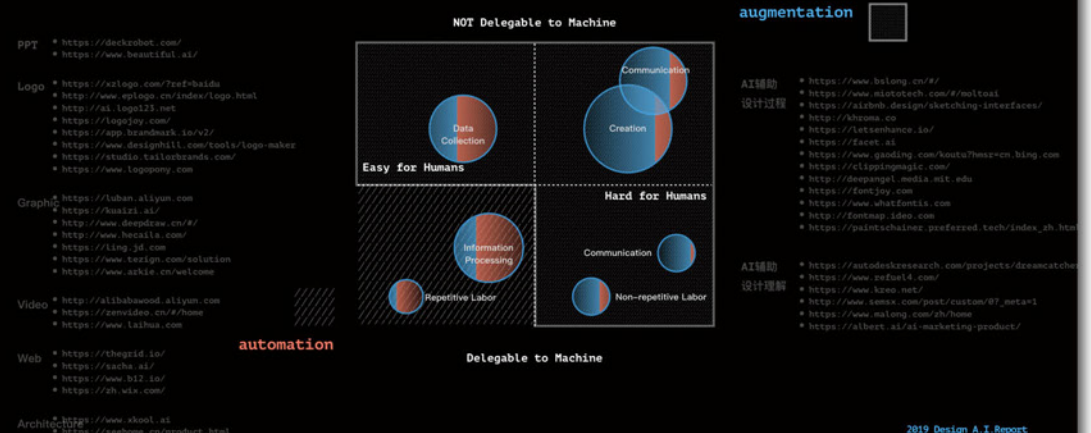

# Machine Ratio<sup>3.0</sup> = Human Machine Trust

Machine Ratio: Some argue that A.I. would replace humans in jobs. This report avoids using the terminology of “replacement”, which signifies threats to the work of humans. It is more appropriate to describe Brain-Machine Ratio as the proportion of work done by humans and machines.

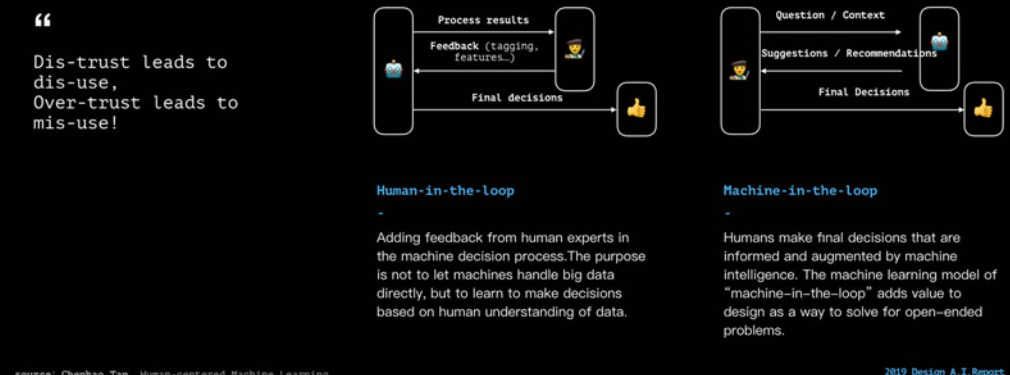

# Human Machine Trust + Collaboration

When studying the influence of artificial intelligence on design, we should turn our attention to domains outside automation. We should think about the complex decisions that are hard for humans. How might machines work with humans to make better decisions?

# Human-centered Machine Learning

Automation is not the sole purpose of machine learning. Machine can also augment human intelligence. Human-centered machine learning can be realized through the paradigms of “Humans-in-the-loop” and “Machines-in-the-loop”.

# STRATEGIC DESIGN OF AGRIFOOD SYSTEM FOR CANAVESE AREA

SYSTEMIC DESIGN  
PROJECT IN OPEN  
SYSTEM LAB,  
POLITECNICO DI  
TORINO.

@ 1bowILIYUFAN

The territory of the Canavese Valleys LAG covers an area of 1120.6 square kilometers in the Northwest of the Piedmont region, in the central sector of the Graie Alps. The moraine hills are characterized by areas of intensive agriculture (Aglìe, Cuceglio, Bairo and Vialfrè are in the Erbaluce wine production area), by administrative and service centers for the surrounding mountain areas (e.g. Cuornè) and by secondary and tertiary production centers.

## project info

---

20 weeks (4 months) / 2020.03 - Ongoing  
Team work / College Project Colabored With  
Canavese Government

---

## project goal

---

Use system design theory and methods to comprehensively analyze agricultural systems in the canavese area and design agro-ecological services that meet sustainable development goals.

3. holistic analysis map

to, to the farm (to feed the animals or use as natural fertilizer), or even to the natural environment. In order to solve the actual problem of waste, it should be considered to transform the linear food system into a circular one. The linear food system into a circular one should grow, reuse and regenerate its own resources.

## topic determination

decide specific topics that are worth to explore further. According to regional characteristics and special agricultural products, the topics for further exploration are:

- cheese production
- wine production
- grain grinding production

## INPUT-OUTPUT MAP OF CHEESE PRODUCING PROCEDURE IN LA CASCINASSA

Taste & texture of cheese depends on the ripening situation, can given to third and to the food eaten by the goats, which is very diversified during summer with the grass and all the different kinds of flowers. However, in the winter the goats go inside and are fed with the stock-feed grass that was mowed in summer.

input output

## Ecosystem services

1. soil formation
2. food
3. water regulation
4. waste treatment

1

The soil can be contaminated by both the use of **fertilizers in open field cultivation to feed animals** and the use of **livestock manure, resulting in nutrient overload (NO3)** on the aquifers and accumulation of metals in the soil from animal manure (Cu and Zn).

2

The remaining **liquid of whey (permeate)** is still considered as a **polluting waste** due to its **high lactose concentration**. Existing research has suggested techniques and methods that can harness this **nutrient-rich byproduct**.

3

About the **water regulation**, the main impactor is **Chiusella river**, it is small water source.

4

Wastewater is a kind of waste in cheese production. The concern is due to the environmental impact of the **discharge of its wastewater**.

**Chlorella vulgaris** is examined for its ability to **grow on saline wastewater** from demineralisation of cheese whey used as the basic component of WCM.

# SWOT analysis

SWOT analysis of the company La Cascinassa.

Strategies for the company

## Strengths

1. It provide a lot of **different kinds of cheese**
2. The production process is **green and healthy**. All materials used can be traced back where and how it is produced
3. Customers can **visit the farm and participate workshops**, which make the customers feel kind and assured
4. Most of the **raw material** (forage, goat, milk) in cheese production are **produced by itself**, therefore the cost is low
5. Only 3 people work here, which is **controllable**
6. It has its **own shop**, in which it sells the products itself
7. It not only produce cheese, but also **salami, cosmetic, dessert** and workshops

## Weaknesses

1. No specific treatment to the **waste water and whey**. It would pollute the river and ground nearby, which would make the environment **unable to support the continuous operation** of the farm
2. Huge amount of **methane and CO2** is produced in the breeding process. Although the cultivation process can absorb a small amount of greenhouse gases, the absorption volume is too small compared to the production volume
3. The **scale of the company is too small** to compete in the market
4. Because of Small scale, few staff, low operating efficiency, there is a development bottleneck. It is **hard to grow** into a bigger scale and make more profits
5. Most products are **handmade**, there is a possibility of **contamination** in breeding, cheese producing and planting

## Opportunities

1. Liquid whey/ by-products can be **reused**
2. Goat cheese is more **healthy and sustainable** than cattle cheese
3. **Local** food to local market
4. **Rise of the cheese consumption** in Italy
5. Rising of **interest in local food** and healthy eating
6. There are many producer associations
7. **Alternative** of animal cheese

## Threats

1. **Vegan** people don't eat cheese
2. The **high amount of fat and cholesterol in cheese** is considered bad to human health
3. Criteria for animal selection
4. The **sudden epidemic** caused the store to close and the workshop was temporarily closed

Opportunities + Strengths = strategy for Increasing

Opportunities + Weaknesses = strategy for Improving

1

- Use characteristics of diversity, healthiness, and localness for promotion,
- Improve operational processes, increase efficiency so that to enlarge company scale.

- The **scale of the company is too small** to compete in the market
- Because of Small scale, few staff, low operating efficiency, there is a development bottleneck. It is **hard to grow** into a bigger scale and make more profits
- Only 3 people work here, which is **controllable**
- It has its **own shop**, in which it sells the products itself
- **Local** food to local market
- **Rise of the cheese consumption** in Italy
- Rising of **interest in local food** and healthy eating

2

- Use **vegan** alternative to meet the **vegan's** need

- **Vegan** people don't eat cheese
- **Cheese is not a so healthy food**
- **Alternative** of animal cheese

3

- Use by-products to develop new products, such as cosmetics

- No specific treatment to the **waste water and whey**. It would pollute the river and ground nearby, which would make the environment **unable to support the continuous operation** of the farm
- Liquid whey/ by-products can be **reused**

4

- Protect the potential of natural resources and prevent degradation of soil and water quality, so that can maintain and enhance production

- No specific treatment to the **waste water and whey**. It would pollute the river and ground nearby, which would make the environment **unable to support the continuous operation** of the farm
- Huge amount of **methane and CO2** is produced in the breeding process. Although the cultivation process can absorb a small amount of greenhouse gases, the absorption volume is too small compared to the production volume

5

- Increase ways of selling, such as e-commerce, provide to agents

- The **scale of the company is too small** to compete in the market
- The **sudden epidemic** caused the store to close and the workshop was temporarily closed

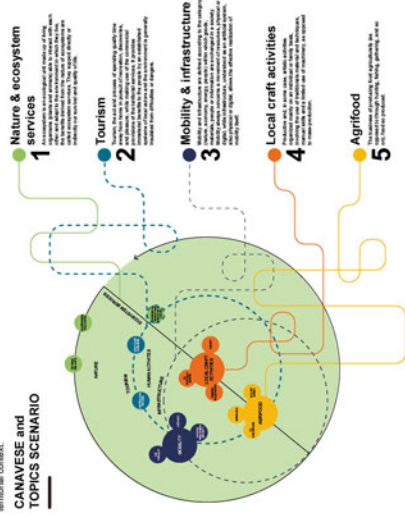

With Canavese we usually indicate that part of Piedmont between the Serra Morenica of Ivrea and the lower course of the Dora Baltea da Mazzo as far as the confluence with the Po, the course of this river as far as the confluence of the Stura di Lanzo, the left bank of the Stura, excluding a small part of the plain north of Turin (Settimo Torinese), then the culminating peaks of the Graie Alps from Levanne to the Gran Paradiso massif (Vallée du Malone, Val di Locana, Val di Soana and Val Chusale).

## ABOUT THE ANALYSIS

The analysis of the Canavese territory was conducted through the analysis of 5 topics representative of the historical and cultural background of the territory. The analysis was carried out by paying particular attention to the production sectors characteristic of the territory and investigating their production lines. The analysis has highlighted the existence of several different problems related to the linearity of the above mentioned production processes.

Thanks to the approach deriving from systemic design, it was possible to identify some operational strategies for the creation of new networks and immaterial flows aimed at transforming the economy and production processes in the territory from a linear to a circular approach.

CANAVESE and  
TOPICS SCENARIO

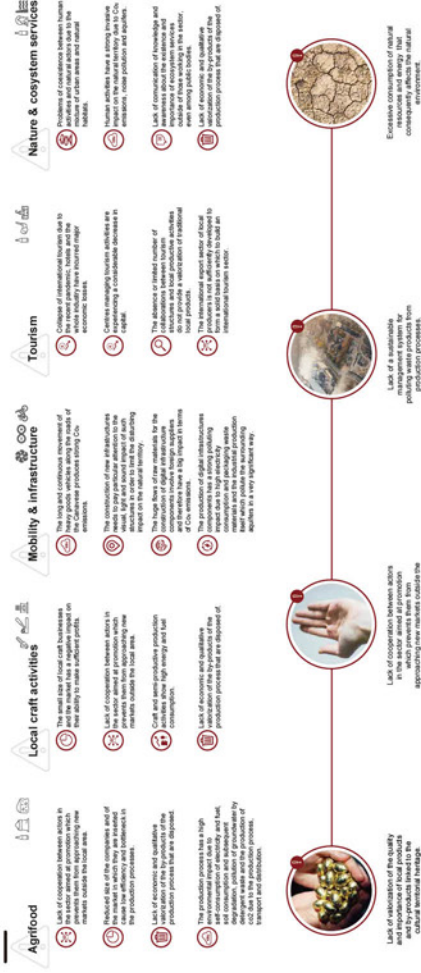

## RECENT HISTORY OF CANAVESE

## SELECTED LOCAL ACTORS

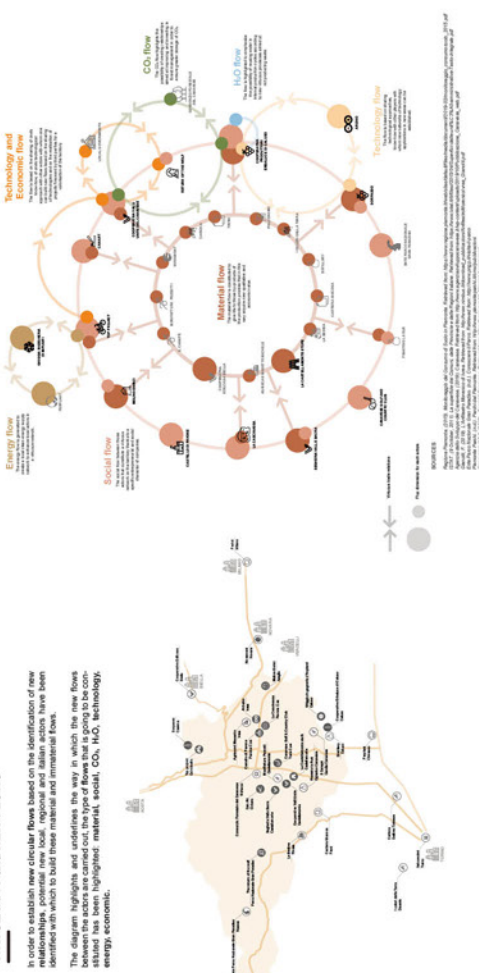

## PROBLEMS IDENTIFICATION

## SYSTEMIC STRATEGIES and OPPORTUNITIES

- 1 Strategies are aimed at creating networks between actors in the area to create virtuous social processes and improve the management of the territory by increasing the exchange of information and exchanging experiences that hope for a shared and shared knowledge.
- 2 Reuse and enhancement of skills and resources in the production process.
- 3 Giving new life to waste by-products by creating new products and services in the production process within the company or by third parties.
- 4 Sustainable management of the natural resources of the territory to reduce its impact on the environment by creating a better balance of CO2 emissions and producing energy from renewable sources, implementing waste management.
- 5 Create a network aimed at the promotion among different actors in order to enhance the cultural and local handicraft production.
- 6 Use of advanced technological management of the production process.
- 7 Improve the experience of using the territory through the creation of innovative products and services and the development of the environment of the product and/or actor with the knowledge of increasing awareness and knowledge of the territory and its
- 8 Sharing of know-how in new areas of application generating economic value through collaboration with third parties.

UT DESIGN FOR UNIQLO

# DIS- CONNECTED

# DIS- CONNECTED

UT DESIGN  
FOR UNIQLO

© 2020

## brand research

This project is out of interest. I drew a series of illustrations that represent the young generation's emptiness and dumb, and tried to apply it to Uniqlo's UT series.

---

### UT series

not only to sell T-shirt,  
but also to sell a young living style.

### Self-expression

use UT to show users' living style, to prove users' existence.

## target people

---

### 22-29, Young generation

They are fresh at work, busy working, busy surfing the social media. They are full of **emptiness and stress**.

**They want to be heard but they lose their own voice.**

## interview

---

### Miss T, 25, fresh at work

"Everything seems normal. I have good job, I eat normally, I exercise everyday, I work hard. But sometimes I just feel wrong. It is like I am stucked or falling down. Sometimes I want everyone can speak to me. but actually I don't want to say anything."

## key word

---

### Screaming silence.

empty, deaf and dumb.

- -Sometimes i want everyone can speak to me but actually i don't want to talk to anyone.
- -Hello? can you hear me?
- -I cannot hear anyone.

# DIS-CONNECTED

## design concept

- Use digital symbols such as unread bubble, breakwire, unplugged earphone to show being disconnected.
- Use a young girl figure to represent the young generation.

## Application

Store image, shopping bag.

# DIS- CONNECTED

I am in a  
SCREAMING  
SILENCE.

## Patterns

Patterns for application.
